Subject inversion in Changana

Jenneke van der Wal & Aurélio Simango

1. Introduction

This paper aims to provide an overview of subject inversion constructions in Changana. From earlier literature, we know that Changana has a so-called Default Agreement Inversion, as illustrated in (1), where the logical subject follows the verb, and the subject marker on the verb is a default class 17.

(via Zerbini 2007: 70)

17sm-fut-go-fv 2-white people
'There will leave the white people.' (Beuchat 1962: 121)

b. kú-tírh-á mú-cháyéri.
17sm-work-1-driver
'There works the driver.' (Códe-Beuchat 1959: 137)

We also know that Bantu languages show much variation in different types of inversion constructions, the valency of the predicates allowing subject inversion, and the semantic-pragmatic interpretation of subject inversion. Investigating these constructions in more detail, we aim to answer the following research questions:

1. Which inversion constructions are used in Changana? (Section 2)
2. Which predicates are allowed in Changana subject inversion? (Section 4)
3. What semantic-pragmatic aspects are present in Changana subject inversion? (Sections 3 and 5)

Especially the structural and interpretational differences between DA and AI receive our attention (Section 3), and in Section 5 we provide detailed arguments to show that transitive expletive constructions (VSO) encode exhaustive focus on the logical subject.

In the rest of this introduction, we provide some background information on Changana. Changana is a Bantu language, SS3 in Guthrie’s classification (Maho’s 2009 update), spoken in southern Mozambique; its sister language Tsonga is spoken in South Africa. As a typical Bantu language, it shows an extensive noun class system (indicated by numbers in the glosses) and agglutinative verbal morphology. Especially relevant for the current paper is the subject marker on the verb, which may be default ku- as in (1), or agree with an argument that may or may not be overtly expressed, like 1st. hi- in (2).

(2) Hi-chel-á mà-dákka ma-karinya.
1pl.sm-put-fv 6-mass loc 6-wheelbarrows
‘We put the cement in wheelbarrows.’

Another relevant feature of Changana for current purposes is lengthening of the penultimate syllable of phonological phrases. Changana does not have contrastive vowel length; instead, long vowels (indicated by a colon following the vowel) mark the right edge of a phonological phrase. This is illustrated in (3), where phonological phrases are indicated by brackets: the subject phrases separately from the verb phrase, but the object is in one phrase with the verb. Kisseberth (1994) analyses phonological phrasing in Tsonga/Changana, showing that not only penultimate lengthening is determined by phonological phrases, but so are tonal processes such as rightward spread of underlying high tones (see also Louw 1983). As tones have not been at the core of our research, we indicate surface tones as observed, but do not use them in our analysis – this will have to await further detailed investigation.

(3) (Ndla:la) (í-gul-á ní má-swé:ko.)
9.hunger 9sm-pullout-ppv Cj 6-cooking.stones
‘Hunger pulls out even the cooking stones.’

With this background, we now present our overview of subject inversion constructions in Changana.

2. Types of subject inversion

Marten & Van der Wal (2014) present an inventory of subject inversion constructions in the Bantu languages, showing 7 different types, differing primarily in verbal agreement and the preverbal element. Apart from Default Agreement Inversion (DAI), the following inversion constructions can be found across Bantu.

In Locative Inversion (L1), a locative DP precedes the verb and determines subject agreement on the verb. There are two subtypes of locative inversion: formal locative inversion and semantic locative inversion (Buehl 2007). In formal locative inversion (FLI), the locative DP is formally marked as locative in a locative class, by a nominal prefix in class 16, 17 or 18 (as in (4)), or by a suffix -ni. In (4b), the subject marker agrees with the locative móngándá ‘in the house’ and not with the postverbal logical subject.

Herero (R30, Marten 2006)

(4) a. Òvá-ndú v-á-hití mó-ngándá.
2-people 2sm-pdf-enter 18-9.house
‘The guests entered the house/home.’

18-9-house 18sm-pdf-enter 2-people
‘Into the house entered (the) people.’

In semantic locative inversion (SLI), the preverbal DP refers to a place, but is not morphologically marked as locative (5).

Zulu (S42, Buehl 2007)

(5) Lesi siqole si-fund-ela izingane ezikhubazekile.
7>this 7.school 7-study-appl 10.children 10.handicapped
‘Handicapped children study at this school.’
The preverbal DP can also be the theme or patient, resulting in Patient Inversion (PI), as illustrated in (6b). The preverbal inzogá 'alcohol' (and not the postverbal agent) determines the form of the subject marker zi in class 9.

Kinyarwanda (Ngoboka 2016: 356)

(6) a. Abáana ndi-ba-nyvá inzogá
    2.children NEG-2SM-drink 9.alcohol
    'Children don’t drink alcohol.'

b. Inzogá ndi-zi-nyvá abáana.
    9.alcohol NEG-9SM-drink 2.children
    'It’s the children who do not drink alcohol.'
    lit. 'Alcohol does not drink children.'

The same construction is found where the preverbal DP has the thematic role of instrument, as in (7), hence called Instrument Inversion (II).

Zulu (S42, Zeller 2012: 134)

    AUG-1a.John 1SM-eat with 7.spoon
    'John is eating with the spoon.'

    AUG-7.spoon 7SM-eat AUG-1a.John
    'John is using the spoon to eat.' (lit. 'The spoon is eating John.')

Even a whole CP complement can precede the verb in subject inversion. It is unclear whether the subject marker, which clearly does not agree with the postverbal logical subject, agrees with the CP or takes a default form (class 8 in (8)).

Kirundi (JD62, Kimenyi 1980: 193)

(8) [Ko abaana ba-gi-ye] by-ilbagi-ve umugore.
    comp 2.children 2-PST-leave-PPV b-forget-PPV lwoman
    'It is the woman (not the man) who forgot that children have left'
    lit. 'That the children have left forgot the woman.'

A final subject inversion construction differs from all the others in still requiring the subject marker to agree with the postverbal subject, hence called Agreeing Inversion (AI), as illustrated in (9).

Makhuva (P31, Van der Wal 2008: 328, 2009: 197)

(9) a. A-náti-ttónyá mákisi.
    6SM-PRES(DR)-drink 6.water
    'There is water leaking out.'

b. Oo-vára ephepélé naphuí ‘úule.
    1SM.PFV.DR-grab 9.fly 1.frog 1.DEM.ILL
    'That frog caught a fly.'

Of these various constructions, we have found that Changana uses DAI widely, and AI in a more restricted way. All other types of subject inversion are ungrammatical. We discuss these in turn.

A semantically locative noun such as ‘hospital’ cannot determine a subject agreement in Changana if the logical subject follows the verb, as shown in (10a). Note that the noun can indeed trigger agreement, if it is the subject of an intransitive predicate, as in (10b).

(10) a. *Xi-bedlele xi-fik-e va-pfumbá.
    7-hospital 7SM-arrive-PFV.NCL 2 visitors
    int. 'At the hospital arrived visitors.'

b. Xi-bedlele xi-ba-file.
    7-hospital 7SM-be.clean-PFV.NCL
    'The hospital is clean.'

Interestingly, what seems to be semantic locative inversion, as in (11a), is only possible when the postverbal DP is interpreted as the object, as indicated in the translation. For the inversion interpretation, where vanhu ‘people’ is the logical subject, speakers change the structure to DAI as in (11b).

    8SM-PFV.NCL 8-hospital 8SM-die-PFV.NCL 2-people 8-many
    'This hospital loses many people.'
    *'In this hospital die many people.'

    LOC 8SM-PFV.NCL 8-hospital 8SM-die-PFV.NCL 2-people 8-many
    'In this hospital die many people.'

When a formally marked locative occurs in initial position, the subject marker is kú-, which is the original class 17 (12a). Changana has lost the Proto-Bantu locative classes and locatives are now marked by the prefix k- and/or the suffix -ni. As a result, the class 17 subject marker now only functions as an expletive. Agreement with the postverbal logical subject is not acceptable here, as illustrated in (12b).

(12) a. Á-xi-bedlele kú-fik-e va-pfumbá.
    LOC 8-hospital 17SM-arrive-PFV.NCL 2-visited
    'At the hospital arrived visitors.'

b. *Á-xi-bedlele va-fik-e va-pfumbá
    LOC 8-hospital 8SM-arrive-PFV.NCL 2-visited
    'At the hospital arrived visitors.'

In the same way, instrument inversion is not acceptable, as shown in (13b).

2 Where no source is indicated, data come from the authors’ joint fieldwork in June/July 2019 in Magude. Examples where the language is not indicated are Changana.
When the patient occurs in a preverbal position and the logical subject is postverbal, the subject marker cannot be determined by the preverbal patient, as in (14a). It is in this case possible to agree with the postverbal subject, as in (14b) but we think this is better analysed as combined left-dislocation of the object and right-dislocation of the subject, as further discussed below.

A 5.shima 1SM-eat-PPVF.CJ 1.Paulo
int. 'It was Paulo who ate the shima.'
The shima ate Paulo.'

A 5.shima 1SM-eat-PPVF.DJ 1.Paulo
'The shima, Paulo ate it.'

The preverbal patient usw 'shima' is followed by an intonation break in (14b), indicated by the comma, which suggests a left-dislocated structure. Furthermore, the postverbal subject Paulo is not presented as the new or contrastive information, which would be typical for an inversion construction (see Marten & Van der Wal 2014 and the discussion below). Instead, (14b) can function as an answer to 'Did Paulo eat the shima?', which suggests that Paulo functions as an afterthought, or at least as backgrounded information, rather than the focus that usually accompanies inverted subjects.

3. Default agreement inversion versus Agreeing inversion in Changana

This naturally brings us to the remaining type of inversion: Agreeing Inversion (AI). As already shown in (12) above, the subject marker cannot agree with a postverbal in situ subject. This is also illustrated in (15).

(15) *Vi-w-e mi-chumu.
4SM-fall-PPVF.CJ 4-things
int. 'Things fell.'

One way to convey the intended meaning in (15) is by Default Agreement Inversion, as in (16).

(16) Kú-w-e mi-chumu.
17SM-fall-PPVF.CJ4-things
'Things fell.'

A second way to improve Agreeing inversion in Changana is to change the form of the verb. Crucially, the form of the verb in (15) is the so-called conjoint form. Like many southern Bantu languages, Changana distinguishes two verb forms within one tense (see Sitoe 2001 for Changana, and Van der Wal & Hyman 2017 for a Bantu overview of the conjoint/disjoint alternation). The conjoint form cannot occur in sentence-final position, whereas the disjoint form can, as shown for the Present Perfective in (17).

2SM-laugh-PPVF.CJ
int. 'They laughed.'

2SM-laugh-PPVF.DJ
'They laughed.'

The conjoint form is used in DAL, as shown in (18a); the disjoint form with its phrase-final penultimate lengthening is not accepted (18b, but see discussion below).

17SM-fall-PPVF.CJ 1-bricklayer
'A bricklayer fell / There fell a bricklayer.'

17SM-fall-PPVF.DJ 1-bricklayer
int. 'A bricklayer fell / There fell a bricklayer.'

Attempting the CJ form in AI results in ungrammaticality, as in (15) above, or an interpretation of the postverbal argument as the object, as in (19) below.

(19) Ti-vükú:lá ti-mbawana.
10SM-bark-FV 10-dogs
'They (class 10) bark at dogs.'
*There bark dogs / 'Dogs are barking.'

However, it seems that what looks like agreeing inversion is possible with the TJ form, as in (20)-(22).

(20) (we know there are thieves around, it's night, and the dogs don't bark for nothing)
T-á-vükúl-a ti-nzwá:na.
10SM-tj-bark-FV 10-dogs
'The dogs are barking!'

(21) (announcement, indicating we have to get up)
W-á-ringá nku:ku.
3SM-DJ-crow-FV 3.rooster
'The rooster crows.'
(22) (answer to 'where is the shima?', when it was left in the kitchen and it's gone when you come back)
Á-jí-fé
1sm-eat-pfv.ti i.Paulo
'Paulo ate (it).'

There are (at least) two interesting observations to be made here. First, there is no penultimate lengthening on the verb. If penultimate length indicates the right edge of a phonological phrase, this means that the verb and the postverbal subject are in one phonological phrase. Second, as indicated in brackets preceding each example, the contexts in which these phrases occur are typical thetic contexts. That is, the whole sentence is presented as one piece of information, rather than establishing a topic and then commenting on that topic (see Sasse 1996, 2006 for discussion of theticity). Since subjects are by default seen as topics, and in an out-of-the-blue context, one piece of information can occur with the exhaustive focus particle 'only' in DAI but not in AI.

Sentence in focused wh words, and corrective focus environment (see Van der Wal 2016). The AI sentence in (21) above cannot be used as an answer to 'who crowed?': the postverbal subject can occur with the exhaustive focus particle 'only' in DAI but not in AI (23); and the postverbal subject can be an inherently focused wh word in DAI but not in AI (24).

Furthermore, AI cannot be used with corrective focus on the postverbal subject (25b); instead speakers indicated that DAI should be used (25a).

17sm-lose-pfv.getC only 1grandparent
'Only grandpa passed away.'

10sm-ôj-bark-pfv 10-dogs only int.
'Only the dogs are barking.'

(24) a. Kú-hízé máni?
17sm-lose-pfv.getC who
'Who passed away?'

b. *A-fük-ilé máni?
1sm-arrive-pfV.ti who
'Who arrived?'

There are (at least) two interesting observations to be made here. First, there is no penultimate lengthening on the verb. If penultimate length indicates the right edge of a phonological phrase, this means that the verb and the postverbal subject are in one phonological phrase. Second, as indicated in brackets preceding each example, the contexts in which these phrases occur are typical thetic contexts. That is, the whole sentence is presented as one piece of information, rather than establishing a topic and then commenting on that topic (see Sasse 1996, 2006 for discussion of theticity). Since subjects are by default seen as topics, and in an out-of-the-blue context, one piece of information can occur with the exhaustive focus particle 'only' in DAI but not in AI.

Sentence in focused wh words, and corrective focus environment (see Van der Wal 2016). The AI sentence in (21) above cannot be used as an answer to 'who crowed?': the postverbal subject can occur with the exhaustive focus particle 'only' in DAI but not in AI (23); and the postverbal subject can be an inherently focused wh word in DAI but not in AI (24).

Furthermore, AI cannot be used with corrective focus on the postverbal subject (25b); instead speakers indicated that DAI should be used (25a).

17sm-lose-pfv.getC only 1grandparent
'Only grandpa passed away.'

10sm-ôj-bark-pfv 10-dogs only int.
'Only the dogs are barking.'

(24) a. Kú-hízé máni?
17sm-lose-pfv.getC who
'Who passed away?'

b. *A-fük-ilé máni?
1sm-arrive-pfV.ti who
'Who arrived?'

(25) Are there cows arriving?

17sm-arrive-pfv 10-sheep

10sm-ôj-arrive-pfv 10-sheep

'No, sheep are arriving.'

In both Al and DAI, however, the subject seems to occupy a low structural position, separating below verbal negation. Both (26a) and (26b) are interpreted as 'some died/fell, but not all'. This suggests that the negative verb is higher than the universally quantified postverbal logical subject, which is presumably in its first-merged position.

(27) a. Á-kú-fá:n-g-á hinkwá-tu.
NEG-17sm-die-pfv all-10
'Not all died.' (e.g. mosquitoes, class 10)

b. Á-yi-w-á:n-g-á hinkwá-ya mi-sinya.
NEG-4sm-fall-pfv all-4 4-trees
'Not all trees fell.'

The fact that AI expresses a thetic statement, as well as the fact that the postverbal subject in Al is in a low structural position (as evidenced by it scopeing under negation) show that it is a true subject inversion construction and should be distinguished from a verb with a right-dislocated subject (see (14) above).

In summary, DAI and AI overlap in being used to express thetic statements, but DAI can also be used for narrow subject focus whereas AI resists this interpretation. Further syntactic variation between DAI and AI concerns the types of predicates that allow subject inversion. This is discussed in the next section.

4. Valency restrictions

AI is only attested with intransitive verbs (see examples above); attempts to create transitive constructions resulted in ungrammaticality for VSO order (27), or an interpretation with right-dislocated subject for VOS order (28).

(27) *T-a-lum-a tí-nyôxixi-khovha.
1osm-bite-pfv 10-bees 7-owl
int. 'The bees sting the owl'

(28) (Did the bees sting the owl?)
Tí-lüm-ôixi khôxwá tí-nyôxí.
1osm-bite-pfv.ti 7-owl 10-bees
'They stung the owl, the bees.'

Whereas some Bantu languages restrict subject inversion constructions to a smaller subset of predicates, Changana DAI allows unaccusatives, as in (24a) above,
Intransitives, as in (29), and transitives, as in (30). Note that DAI only allows VSO order for transitive predicates, not VOS (31).

(29) (hearing a noise on top of the mini-bus)
Kú-tsitsim-á huuku.
17Sm-run-fv 9.chicken
'There is a chicken running.'

(30) (describing a video of a woman measuring flour)
17Sm-measure-appl-fv 1-seller tapioca
'The seller is measuring tapioca.'

(31) Kú-lúm-á xi-khávati-nyéxi.
17Sm-bite-fv 7-owl 10-bees
'The owl bites the bees.'

"The bees bite the owl.'

Two of our speakers also sometimes accepted inversion with a ditransitive as in (32) and (33), which one speaker rejected, characterising it as 'you're saying the same but walking backwards.' Further investigation with another 7 speakers shows again a mixed picture.

(32) (there are four geckos and all happen to have caught a mosquito)
Kú-já mi-kólomba: ñóówá-yyu ti-muçna.
17Sm-eat-fv 4-geckos all-4 1.0-mosquitos
'All geckos eat mosquitoes.'

17Sm-give-pfv.cj 1.grandparent 2.children 4-mangos
'Grandma gave the children mangoes.'

As an interim summary, we know that AI only allows intransitive predicates, requires the disjoint verb form, and expresses a thematic sentence, whereas DAI allows transitive predicates as well, features the conjoint verb form, and is underspecified in expressing the topic or narrow focus on the postverbal logical subject. There is, however, a restriction in the interpretation of transitive DAI, to which we turn now.

5. Transitive DAI for exhaustive subject focus

As noted for other southern Bantu languages, with a transitive predicate, DAI is less flexible in its interpretation. Ndiyavadije (1999) demonstrates this for Kirundi, Zerbian

\[\text{The same expletive agreement is also used in impersonal constructions such as the passive of an intransitive, illustrated in (i), although this of course does not qualify as a subject inversion construction, as there is no postverbal logical subject.}\]

(i) (What's happening on the football field?)
Namüntá l-i-tsitsim-lw-a.
today 17Sm-iy-run-pass-fv
'Today there is running.'

\[\text{Transitive DAI is also known as a transitive expletive construction.}\]

(2006) for Northern Sotho, and Carstens & Mletshe (2015) for Xhosa, among others. All show that in VSO order, a thematic interpretation is no longer available, and focus is narrowly on the postverbal logical subject. Furthermore, the type of focus seems to be exclusive focus. In this section, we use various diagnostics to show that in Changana, to o, transitive expletive constructions express narrow subject focus. We present arguments for this analysis in turn.

First, the idiomatic reading is retained for the object in VSO order (34), but not for the subject (35). We know that parts of fusions are not compatible with focus, as it is impossible to find a set of alternatives to the idiomatic interpretation. Therefore, the fact that the idiomatic reading is lost forms evidence that the subject in VSO order is in focus.

(34) Kú-khav-é vá-yící páráúti.
17Sm-kick-pfv.cj 2-thieves 5-plate
idiomatic: '(the) Thieves died.'
non-idiomatic: '(the) Thieves kicked the plate.'

(35) Kú-phukw-é kondó neele.
17Sm-fall-pfv.cj 5.mouse 9.hole
idiomatic: "The thief was caught.'
non-idiomatic: 'The mouse fell (to reach) the hole.'

Second, note that (35) can be an answer to a question 'who failed (to reach) the hole?', showing that in the non-idiomatic reading the subject in VSO order is focused.

Third, example (34) is felicitous in a situation where there are thieves and police, and both have guns, so it's a matter of seeing which of the two groups end up dying. This shows that the (non-idiomatic) subject is interpreted as focused, and furthermore, that there are alternatives (the police, in this case) that are excluded.

Fourth, when forming a subject who question in this construction as in (36), the speakers indicated that this suggests a choice between alternatives, as indicated in the translation.

(36) Kú-kök-á máñi xí-tú: a?
17Sm-pull-fv who 7-chair
"Who (of these people) is pulling the chair?'

Fifth, whereas an indefinite non-specific reading is possible for intransitive DAI (37), this reading is excluded for transitive DAI – instead, the word 'person' is interpreted as a type, 'human being' (38). In order to arrive at the intended non-specific reading, a presentational DAI construction as in (39) must be used. These facts can be understood if the subject in VSO order requires the exclusion of alternatives: indefinite non-specific 'someone' does not allow exclusion of anyone, whereas the type 'human being' allows for the exclusion of other types, such as cats or monkeys.

(37) (you shouldn't have sprayed the water on the road, it's muddy now and...)
Kú-tá-w-á mú:nú:
17Sm-fur-fall-fv 1-person
'Someone will fall.'
(38) (imagine we’re on a different planet where cats can also cook)
Kù-své-ká mú:hnu mpùnqa
17sm-cook 1-person 3.rice
‘A human being is cooking rice.’

*Someone is cooking rice.*

(39) Kù-ní mú:hnu a-své:ká mpùnqa?
17sm-with 1-person 1sm-cook=núl. 3.rice
‘Is there someone preparing rice?’

Sixth, transitive DAI can felicitously be used to restrict the set of referents for which the proposition is true. When in the context of (40) an “overcomplete” question is asked, incorrectly referring to more than one referent, the corrective reply can be a transitive DAI as in (40). Considering that it is not necessary to add ‘only’ in this construction, we conclude that the transitive DAI here expresses exhaustive focus.

(40) (Did Aurelio and Quinito cultivate the field?)
Aurelio and Quinito cultivated the field.

Finally, a remarkable interpretation is encountered when testing the scope of negation. The first interpretation given by our speakers for (41) negates the exhaustivity of the subject (the subject is not the only referent for which the statement is true), as given in translation a), rather than the truth of the statement for the subject, as in b), which was also accepted as a possible interpretation.

(41) A-kù-phís-úngáí mpündlá mú:tí
PST-1SM-drink-NEG-FV 3.hare 6.water
a. ‘It wasn’t only the hare who drank water.’ (other animals drank too)
b. ‘It wasn’t the hare who drank water.’

One example is in line with a focus function, but argues against an inherently exclusive interpretation: the subject VSO order is accepted when modified by ‘even’, as in (42). This is unexpected under the hypothesis that the postverbal logical subject in transitive DAI expresses exclusive focus, because ‘even cats’ includes all the other relevant referents and does not exclude any of them (therefore being incompatible with an exclusive reading).

(42) Kù-své-ká ní sú-píxi mpùnqa.
17SM-cook-FV and 8-cats 3.rice
‘Even cats are cooking rice.’

This suggests that the postverbal logical subject in a transitive DAI (VSO order) is in narrow focus, but the exclusive interpretation that surfaced with the other tests does not seem to be inherent to the meaning of transitive DAI, but rather pragmatically associated with it.

6. Summary

In this paper we have for the first time systematically surveyed the subject inversion constructions found in Changana. Changana does not show evidence for patient inversion, instrument inversion, and locative inversion (formal and semantic), although it would be interesting to further investigate the types of (transitive) predicates that allow a preverbal locative as a true subject, as in (11a).

Agreeing Inversion, whereby the subject marker agrees with the postverbal subject, is accepted with intransitive predicates only, takes the disjoint verb form, and is associated with a thitic interpretation. Default Agreement Inversion, on the other hand, is accepted with all valencies, takes the conjoint form, and can be used for thetic expressions as well as focus on the postverbal logical subject. This can be simple focus (for example in question-answer pairs), or exclusive focus. However, transitive DAI, which shows VSO order, does not allow a thitic interpretation, and the focus on the postverbal subject is sensed to be exclusive.

Further research should investigate the underlying syntactic structure of either inversion construction, especially in the light of the restriction to subject focus in VSO order and questions about argument licensing. For Xhosa, Carstens and Mletshe (2017) argue that Focus licenses the postverbal logical subject in transitive expletive (VSO) constructions (and see Halpert 2016 for Zulu DAI). The data from Changana might bring further insight into this issue.

Acknowledgements

The research reported here is part of the BaSiS project, funded by NWO Vidi grant 276-786-001. We would like to thank José Cossa, Josíto Sitoe, and Mateus Javane for sharing their knowledge with us, and Ezra Nhampoca and Armando Ngunga for further help and judgements.

Abbreviations and symbols

We follow Changana orthography, but we write vowel length with a tilde under the vowel, and we have added surface tone marking. High tones are indicated by an acute accent, low tones are unmarked, downstep is indicated by a superscript exclamation mark.
